

EL MARATÓN DE MOSCÚ

Participants per country colored by age.

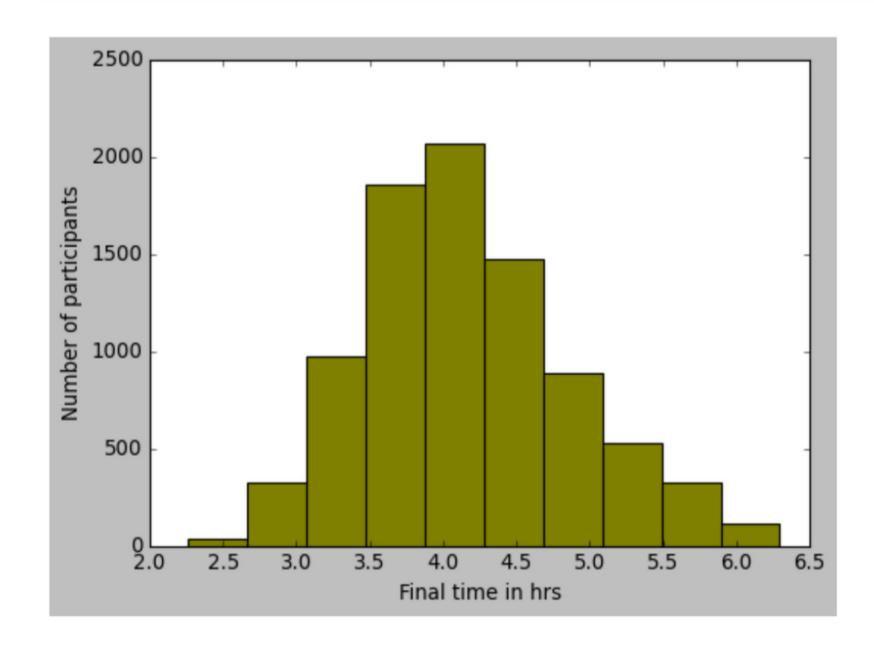

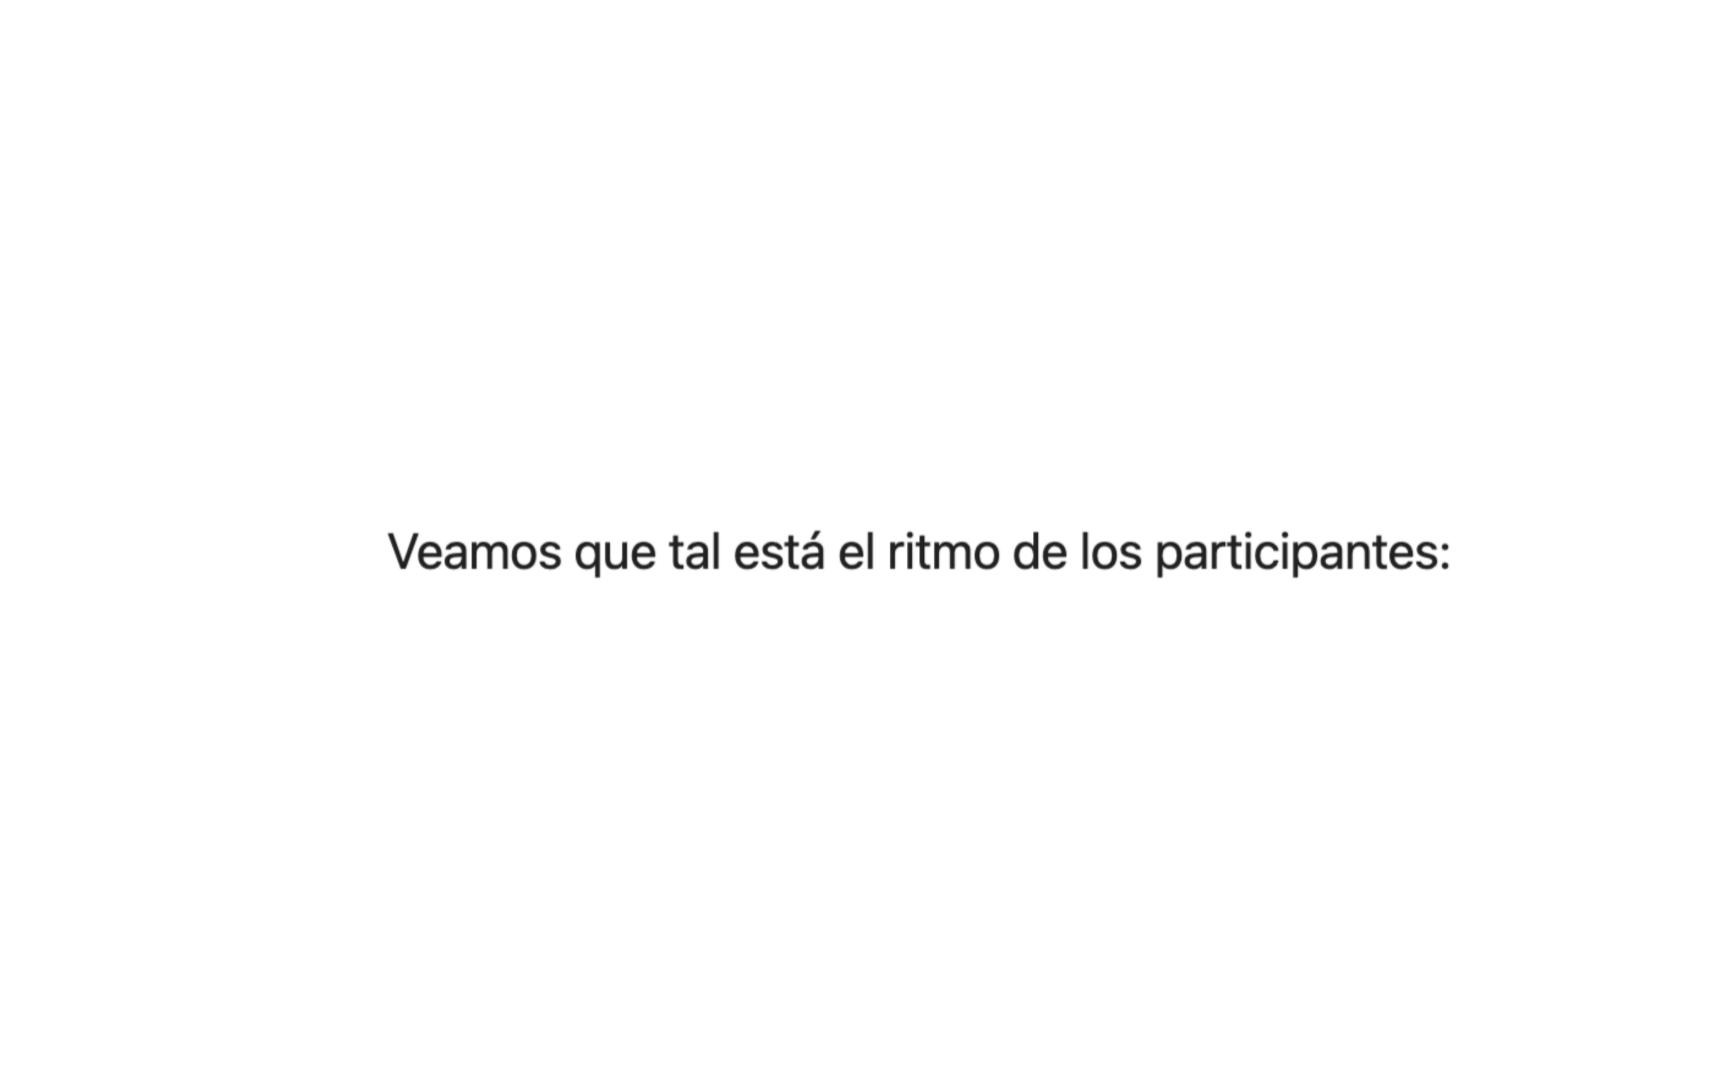

58.17

Visualicemos la distribución de los tiempos finales de los participantes...

In [13]:

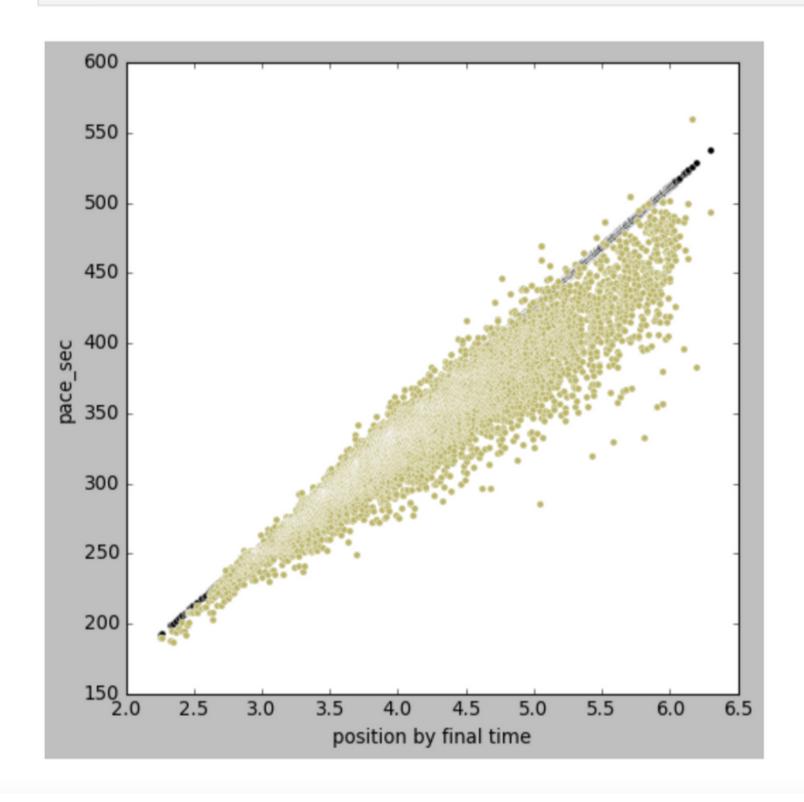

```
plt.figure(figsize=(7,5))
plt.hist(mscw['time_hours'],color='olive')
plt.ylabel('Number of participants')
plt.xlabel('Final time in hrs')
plt.show()
```

In [16]:

```
plt.figure(figsize=(7,7))
sns.scatterplot(data=mscw, x="time_hours", y="pace_sec",color='black').set(xlabel='position by final time')
sns.scatterplot(data=mscw, x="time_hours", y="half_pace_sec", color='darkkhaki')#.set(ylim=(0, 6.5))
plt.show()
```

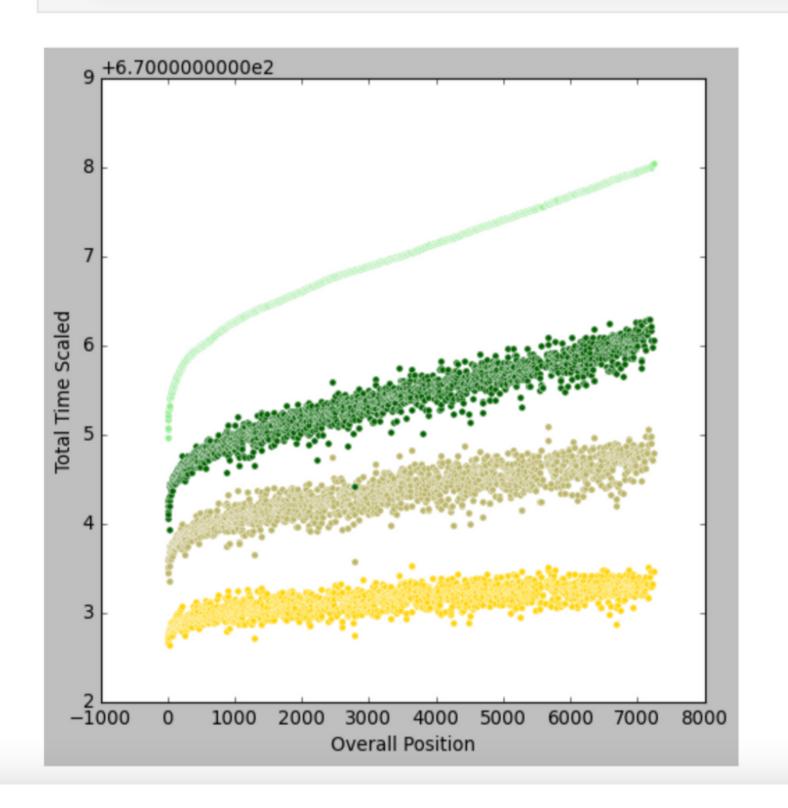

Veamos datos de otro maratón

Aunque los siguientes datos no pertenecen al maratón de Moscú del 2018, el comportamiento observado es replicable en otros maratones.

```
In [18]:
```

```
plt.figure(figsize=(7,7))
sns.scatterplot(data=china, x="Overall Position", y="10ktimes",color='gold').set(ylabel='Total Time Scaled')
sns.scatterplot(data=china, x="Overall Position", y="halftimes", color='darkkhaki')#.set(ylim=(0, 6.5))
sns.scatterplot(data=china, x="Overall Position", y="30ktimes",color='darkgreen')#.set(ylim=(0, 6.5))
sns.scatterplot(data=china, x="Overall Position", y="finaltimes",color='lightgreen')#.set(ylim=(0, 6.5))
plt.show()
```

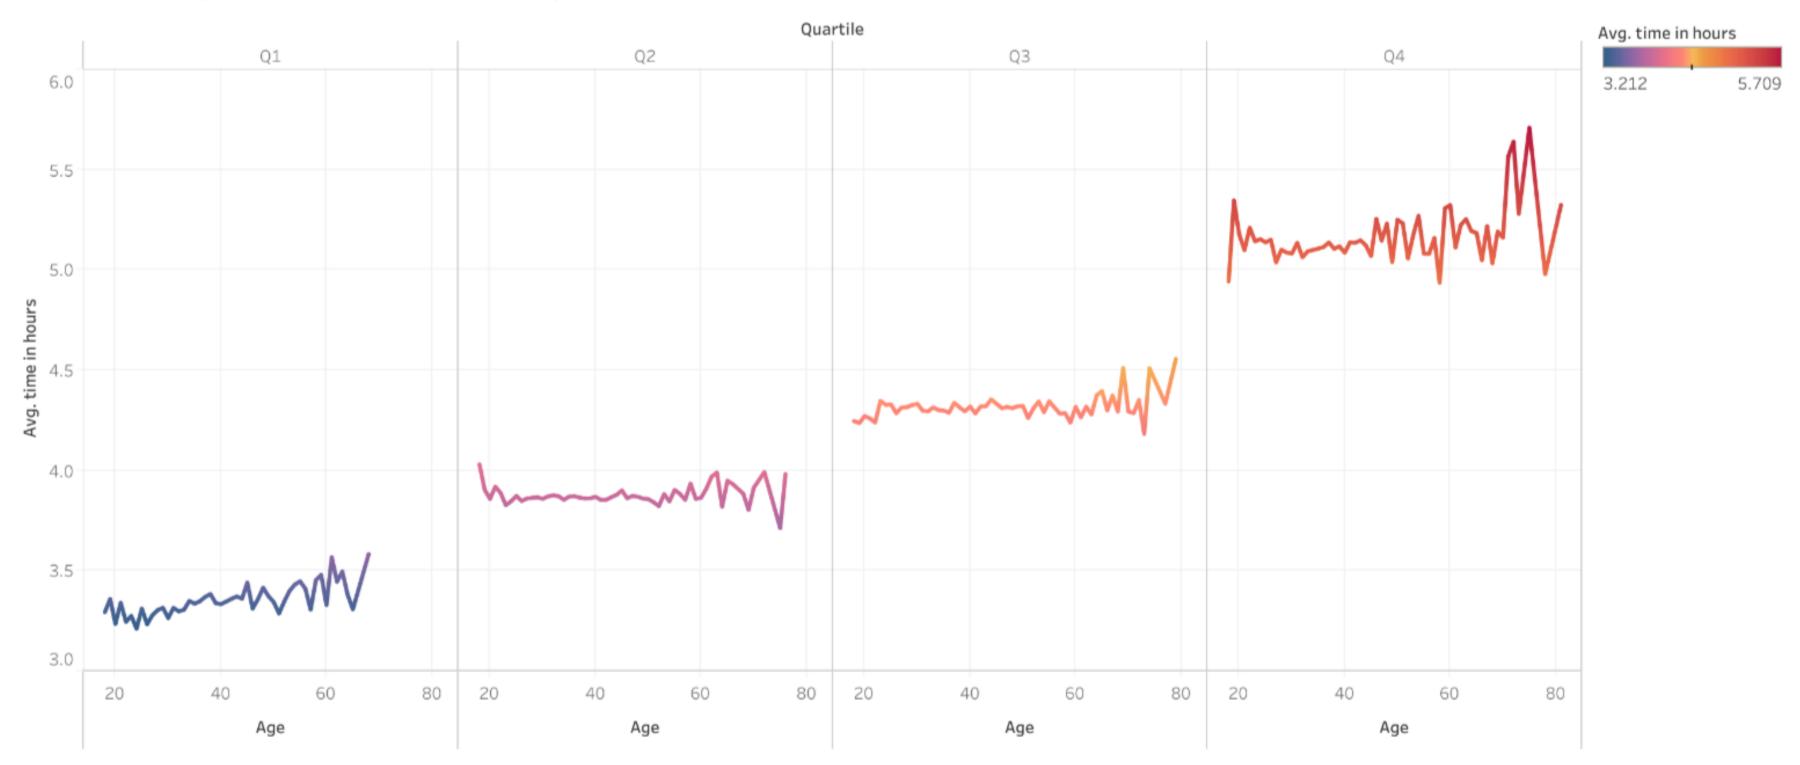

Back to the Kremilin...

Performance by region and quartile in hours and age, colored by age.

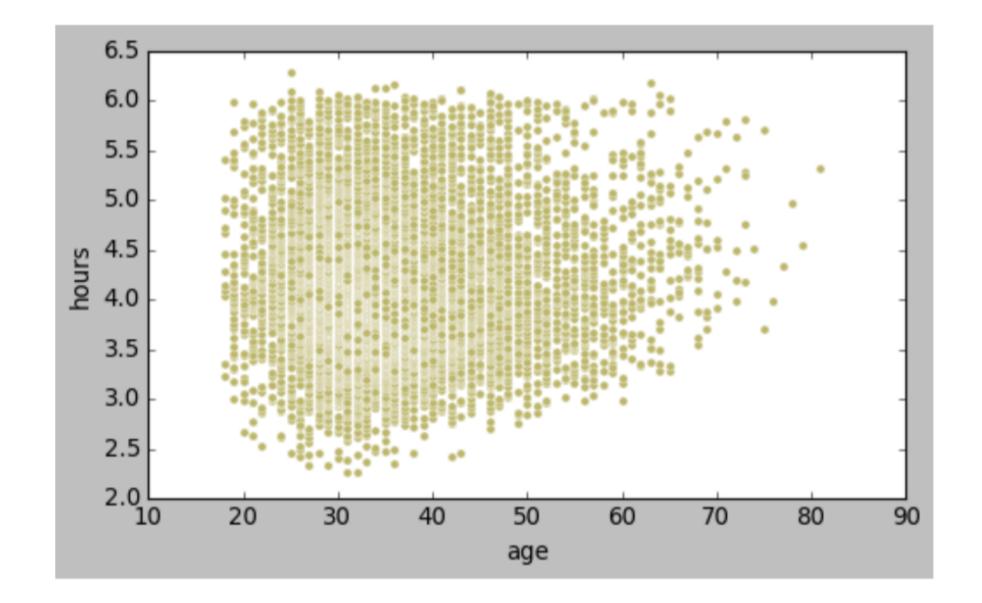

performance by quartile and age colored by pace in seconds

¿Es la edad realmente un factor decisivo?

In [19]:

```
plt.figure(figsize=(7,4))
sns.scatterplot(data=codes_mscw, x="age", y="time_hours",color='darkkhaki').set( ylabel='hours')
plt.show()
```

In [22]:

```
age=pd.concat((mscw,bins),axis=1)
pd.pivot_table(age,index='age_range',values=(('time_hours','age')),aggfunc={min, max, np.mean,np.std})
```

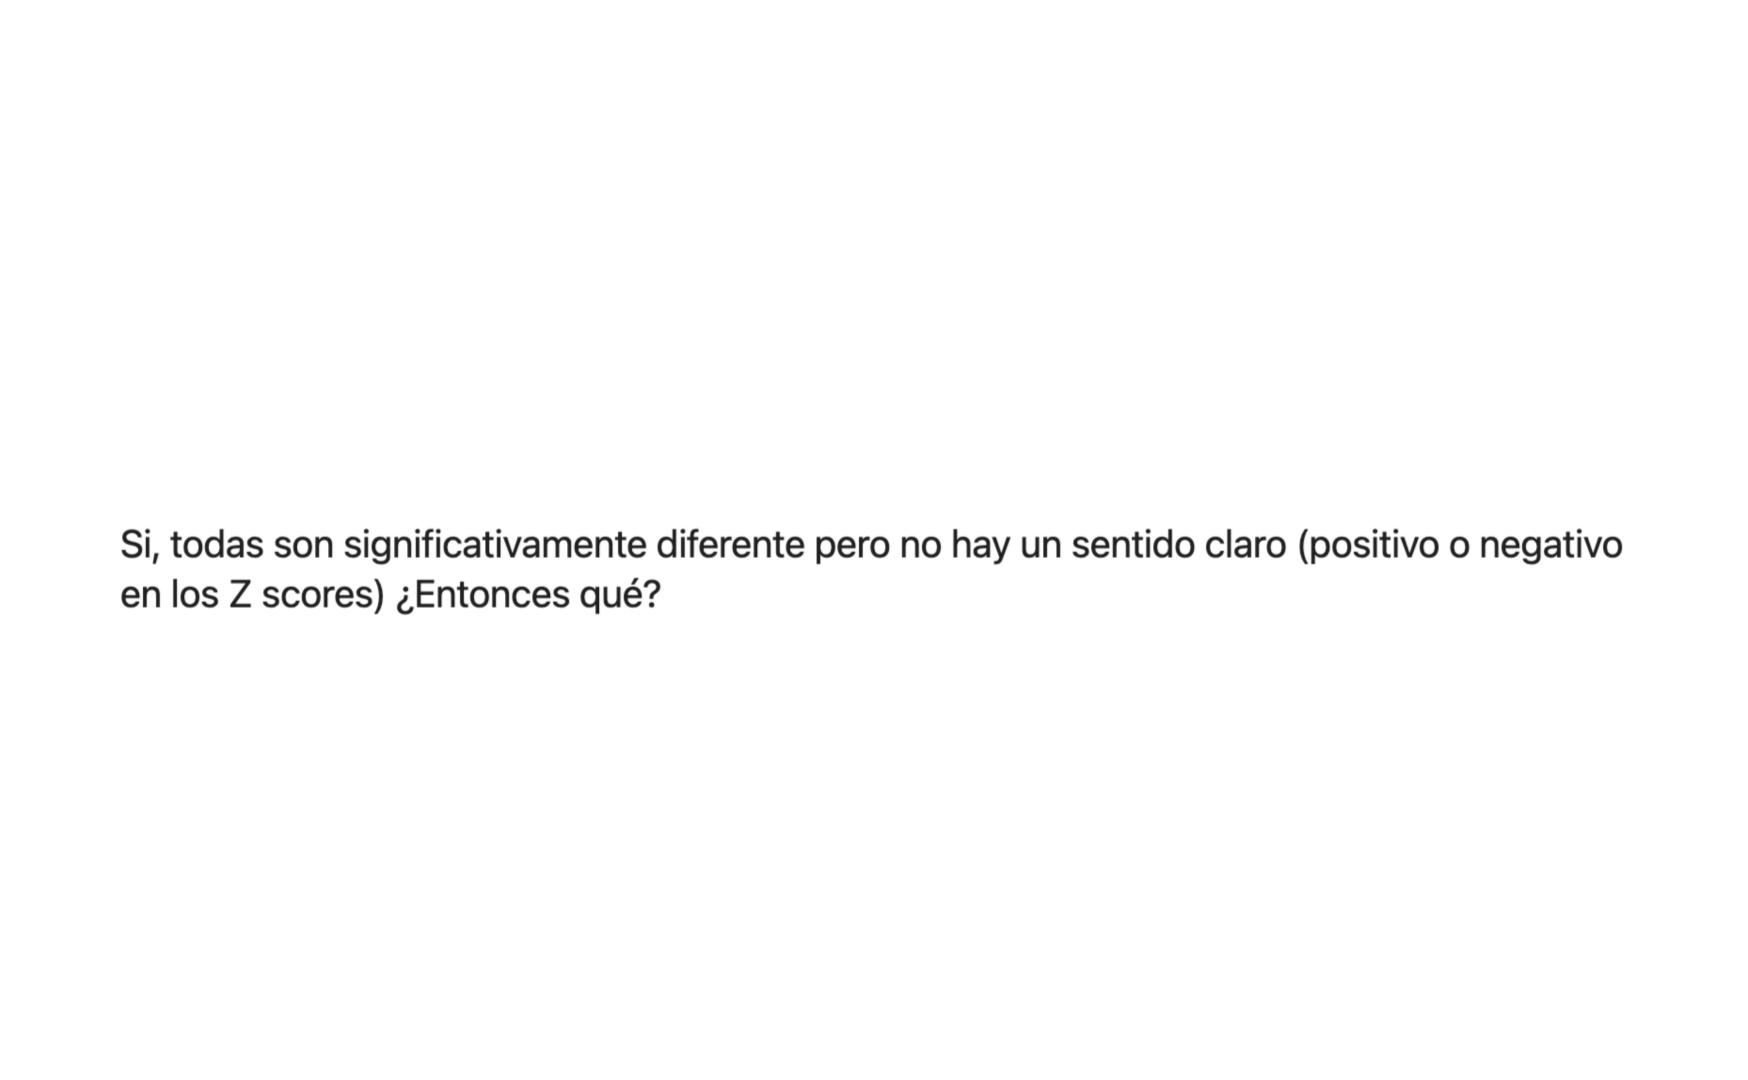

Out[22]:

	age					time_nours		
	max	mean	min	std	max	mean	min	std
age_range								
(0-28)	28	25.282163	18	2.530645	6.297778	4.204095	2.331667	0.723213
(29-39)	39	33.579362	29	3.035358	6.160556	4.110546	2.256111	0.690183
(40-49)	49	43.724760	40	2.778067	6.111111	4.173286	2.427222	0.704297
(50-60)	60	53.956882	50	3.072999	6.027222	4.220260	2.843056	0.726409
(61-70)	70	64.360759	61	2.657086	6.191944	4.521145	3.285556	0.680354
(70+)	81	74.050000	71	2.837252	5.813611	4.808153	3.713056	0.671063

Buscamos que la media de los grupos sea significativamente differente de la medía en general.

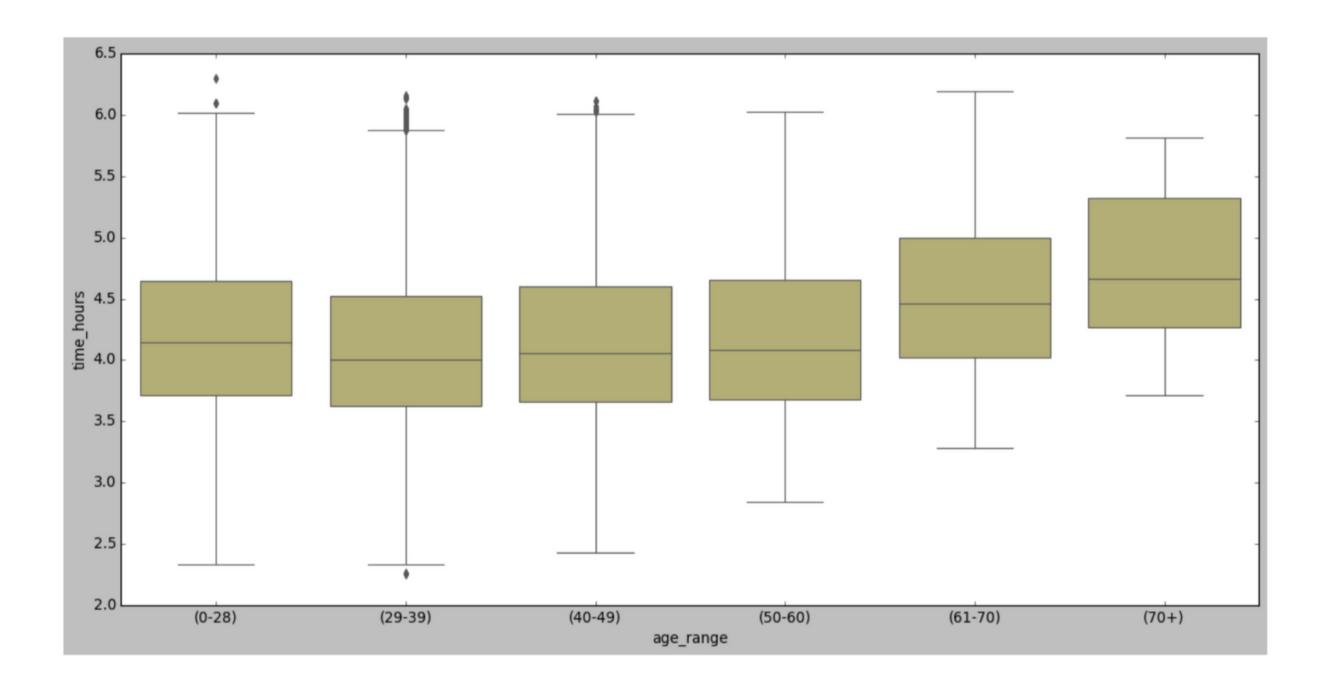

Recuerda que la media original es: 4.157781

```
In [24]:
               ztest(mscw['time_hours'], value=4.204095)
Out[24]:
               (-6.093653685152342, 1.103622802917605e-09)
In [25]:

In [26]:
               ztest(mscw['time_hours'], value=4.173286)
Out[26]:
               (-2.0400047079668973, 0.041349856820062786)
```

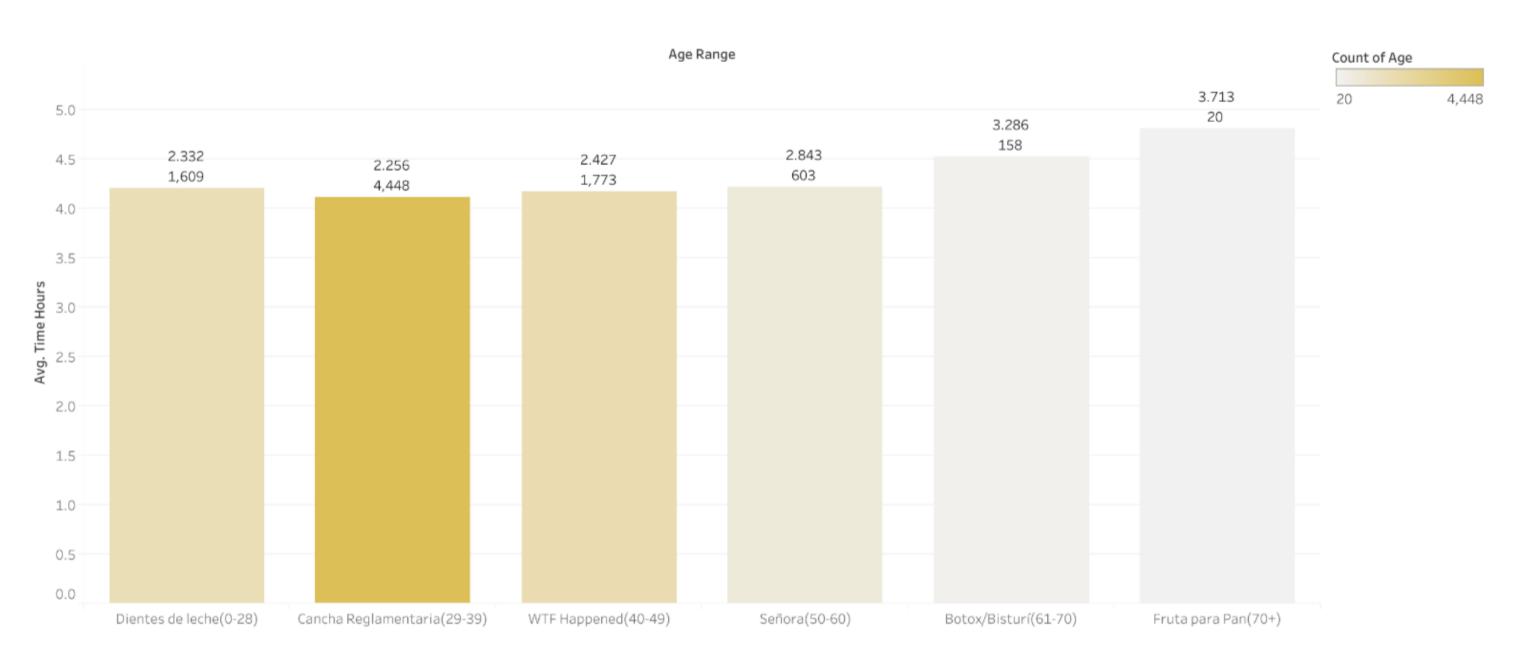

In [30]:

```
plt.figure(figsize=(17,8))
sns.boxplot(data=age, x="age_range", y="time_hours",color='darkkhaki')#.set(ylim=(0, 6.5), ylabel='Hours')
plt.show()
```

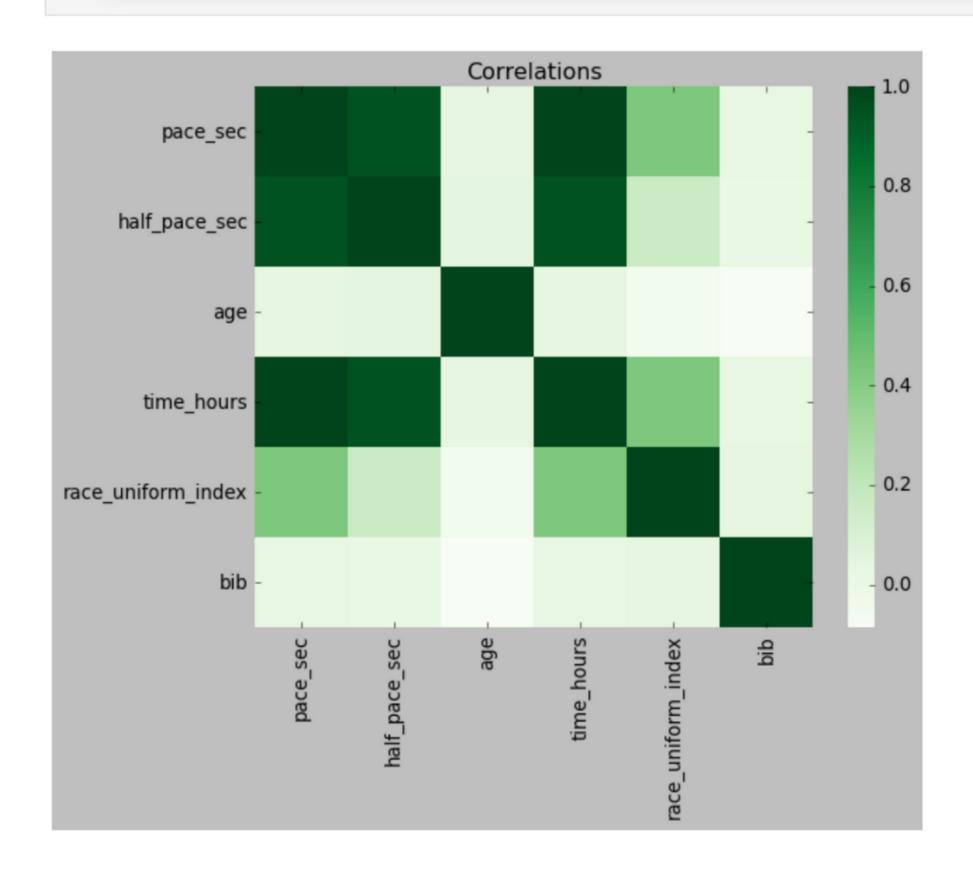

age ranges data

Con este sample no podemos determinar que la edad tenga mucho que ver con el éxito en un maratón.

```
In [61]:
```

```
sns.heatmap(matrix,cmap="Greens")
plt.title('Correlations')
plt.show()
```

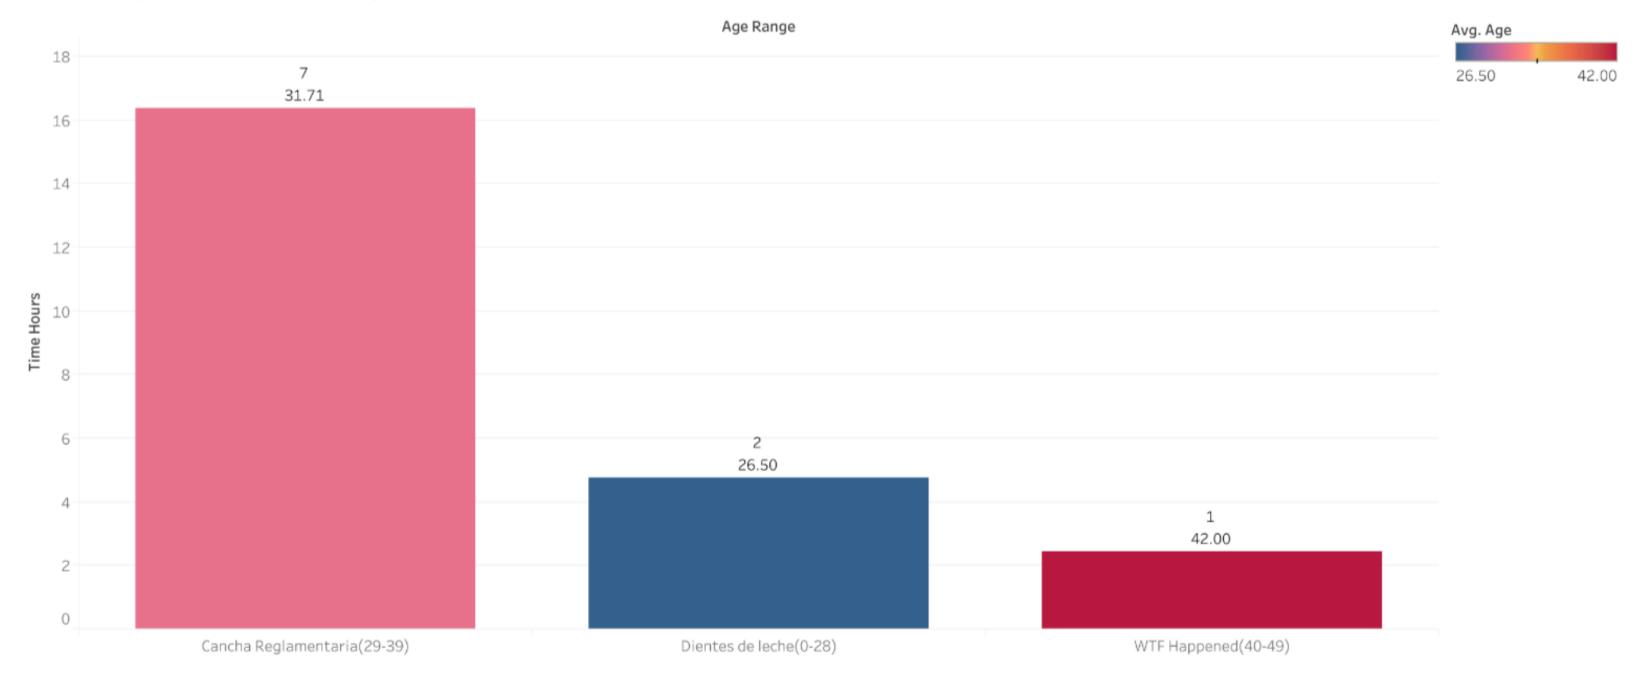

- 1. La edad tal vez no sea un gran factor determinante. Pero si lo fuera estoy en el rango preciso. Es ahora o nunca.
- 2. El ritmo constante parece ser un factor común en los participantes con mayor éxito.
- 3. Si eres al menos más rápido que la mitad de los participantes, deberias terminarlo en aproximadamente 4hrs y 9 minutos. Basado en mis entrenamientos hasta ahora. Lo más probable es que no sea más rápido que el 50%.

More like the bottom 10%. At least in something I'm a 10-percenter.

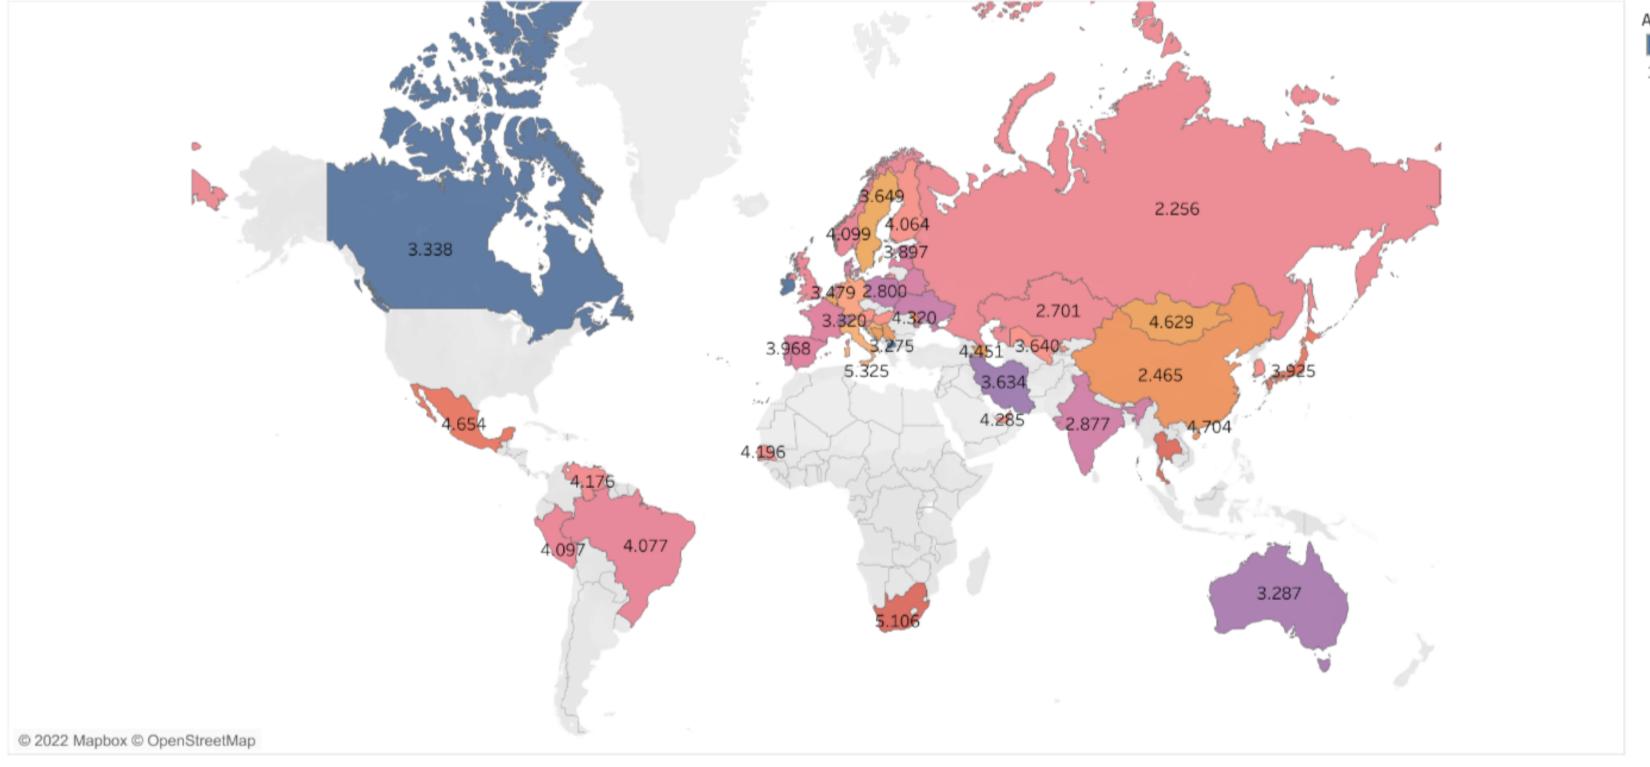

4. Los mexicanos literal están en todos lados, osea había 5 mexas en Moscú.

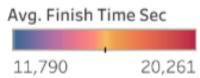

RESULTADOS FINALES

Winners by Age Group and Tally

Average finish time per country labeled by fastest and colored by average.

Спасибо (Gracias!)
